

Renderplas championing British excellence in the plastering industry

15 July 2025

In an increasingly international market, Renderplas stands as a key example of British manufacturing prowess across the construction supplies sector. For over 35 years, the Midlands-based company has been steadfastly supporting the UK's builders and developers with unparalleled supply chain efficiency and innovative PVC beads.

A strong supply chain

One of the keys to Renderplas' steady success in a fiercely competitive field lies in its commitment to fostering strong relationships with major national builders' merchants. This strategic partnership ensures that Renderplas products are readily available across the UK, with stockists located as far north as the Shetland Isles and as far south as Penzance in Cornwall.

Having such a robust supply chain means that Renderplas can support any construction project nationwide with both render beads and plaster beads of the correct quantity and specification. PVC beads from the company can be quickly sourced from local inventories held by the merchant network, providing customers with ultimate accessibility and peace of mind.

Impressive product range

When it comes to product innovation, Renderplas stands out for its pioneering development of PVC beads. These products are already the preferred choice for any good specifier or contractor, especially in coastal areas, surpassing even stainless steel beads in durability and performance in these application

environments. The secret to their success lies in Renderplas' investment in new designs and manufacturing techniques, which offer superior longevity and versatility when compared to other solutions.

After more than 35 years spent working alongside British developers and builders, Renderplas has built up a wide range of products that cater to the sector's needs, including plaster corner beads, expansion joint beads, and shadow gap beads. It offers beading in a broad range of colours and depths designed to match the requirements of any project.

With sustainability being a key requirement for construction projects, Renderplas can help builders and specifiers meet low carbon targets. Its white stop beads, corner beads and bellcast beads are manufactured from 100% recycled PVC, whilst its movement joints and beads of other colours contain a minimum of 75%.

As Renderplas continues to expand its horizons and innovate within the plastering industry, it remains anchored by its core values of quality, reliability, and customer service. For builders, developers, and contractors seeking a partner that truly understands the intricacies of their craft, Renderplas offers more than just materials; it provides a foundation for success built on decades of British excellence.

About Renderplas

Renderplas was formed in 1990 to offer the plastering industry a new concept in beading. The first manufacturer of PVCu beads in the UK, Renderplas is the leading exponent in the field.

The business sets out to address the shortcomings of traditional profiles by designing a range of beads in PVCu to suit the British and Continental market. The key benefit of PVCu beads is that they use the most cost-effective, non-corrosive material to produce robust plasterer friendly beads. Renderplas PVCu beads conform to BS EN 13914-1:2016 - External Rendering.

Renderplas products are designed to be unobtrusive with an extremely narrow arris, making it ideal for scratched or scraped finishes. Very popular with major house builders, its beads are available in white or ivory as standard to blend with most coloured renders. However, in order to give architects and contractors even more freedom to use through-coloured renders in more vibrant colours, a range of beads in 7 further colours are also available for popular render depths.

Used internally, whether, in conjunction with wet plastering or dry lining, they will not stain during lengthy drying out periods and offer superior protection against impact in heavy traffic areas.

By specifying a Renderplas PVCu bead, the problems associated with traditional beads and the aggravation of costly callbacks are avoided. Two different CAD file formats are available for Renderplas profiles from the Downloads page of its web site. Alternatively, register with FastrackCAD to use all of their architectural database services.
